

Mobile UX / UI redesign directions

Nine screen directions on the app's existing tokens — the dark palette from `theme/theme.css`, Archivo / Archivo Narrow, Material Symbols Rounded. Every current capability survives; what changes is the order of operations and how much chrome sits between the user and the one thing they're doing. Frames are 390 × 844.

Refines 1b — the direction you picked.

Reps now sit beside weight as an equal, labelled –/+ control, with the prescription's target range shown above it and the value tappable for the keypad when you want to type. Logged sets grow an *edit* glyph, so fixing set 1 is one tap and reopens this same block — nothing is write-once.

 Ingredients 10

✓

~~Press the tofu 10 min between kitchen paper under something heavy, then cube. Start the rice.~~

✓

~~Toss the tofu in cornflour with a good pinch of salt until every face is dusted.~~

3

Fry in a hot, generously oiled pan, turning only when each side has properly crusted — 8–10 min total.

9:00

✓ Done, next step

4

Mix **gochujang 4 tbsp**, **soy 4 tbsp**, **rice vinegar 2 tbsp** and a splash of water into a glaze.

5

Char the broccoli in a dry hot pan with a splash of water and a lid, **4 min**.

6

Kill the heat, pour the glaze over the tofu and toss to coat. Serve on rice, scattered with spring onion and sesame.

Your bowl only — extra gochugaru or chilli crisp.

FRYING — STEP 3

6:12

+1m

×

No paging through individual steps.

All six steps, one scroll, no paging. The step you're on is the only card — bigger type, a start-timer chip built from the duration in its own text, and a *done* button that just moves the highlight down. Finished steps collapse to struck-through grey so you can still read back. Any duration in a step is tappable to start a timer; a running one lives in the dock. Ingredients are a header button rather than a wall of text, and the ×2 scaling is applied inline where each quantity is used.

Focus — one move at a time

Move-rail to jump; rest is the dock.

One move fills the screen. The move-rail at the top is how you jump — forwards, backwards, or to fix set 1 of move 1. The dock is the timer; when nothing is resting it becomes a single green *Log 75.0 × 5* button in the same slot, so your thumb never moves.

The basis for 2a.

Smallest change from today: the vertical list of moves stays, done moves collapse to one line, and the active move expands. No number keyboard at all — ± 2.5 kg and a rep row. The rest timer is a slim line inside the same dock as the log button, never a second panel.

One-tap — preloaded from last time

Fewest taps; most to learn.

The set is already filled in from last time — the normal case is one tap on the green button and rest starts itself. Deviating is a tap on the weight strip. Sets become four small cells you can glance at, not four rows you scroll. Fewest taps of the three; most new to learn.

Search-first list + filter sheet

Replaces two scrolling pill rows.

Filters collapse into one *tune* button with a count; active ones show as removable chips. Meta becomes one dim line instead of five badges, so ~7 recipes fit per screen instead of 3. Favourites and recently-cooked ride on top. Tapping a row opens the recipe full-screen (not an in-place expand).

The filter sheet behind 1d

Every existing filter, plus heat, time, favourites.

Every existing filter plus heat, time and favourites — one thumb-reachable sheet, 44 px targets, live result count on the confirm button. Nothing permanently occupies the list header.

Week at a glance + browsable picker

Replaces the 77-item native select.

All seven days as rows, so the whole week fits on one screen. The native `<select>` becomes a searchable sheet that can suggest by "not cooked recently" — your existing auto-suggest, made visible. *Send week to shopping list* moves to a bar that appears once the week has gaps filled.

Today on four tabs

Train absorbs Calendar / Moves / Stats.

Six tabs → four, each 97 px wide instead of 65. Train holds Calendar / Moves / Stats as a segmented control at its top — the same one Food already uses, so no new pattern. Today gains the two things you actually decide in the evening (sauna, tonight's dinner) and a quick-log entry point.
